Creative Coding I

Similarities between GUI & CLI

First, I will be talking about GUI (Graphical User Interface). The GUI is a user interface that allows the user to use electronic devices with graphic icons & visual indicators. As a beginner, I would use GUI because it is easier to use compared to CLI, but in GUI you need to have a better memory because of all the graphics when using that coding. That said it is a slower program that is easier to learn and more flexible when making errors on the coding portion. CLI is definitely harder to learn because of the amount of text on lines, but it doesn't require much memory at all. CLI is also faster compared to the slow GUI, but you can't change the appearance of the coding that you are using and it isn't flexible. I am curious to see which one we use more in class or if we will just be using either GUI OR CLI.
